Building Content: Creating Learning Modules

A Learning Module is a collection of Content Items focused on a specific subject that students can navigate at their own pace. For example, a Learning Module about types of clouds can include lecture notes, links to websites with pictures of cloud types, and assignments. Instructors can create a structured path for progressing through the items. The path can be set so that students must view content sequentially, or set to permit users to view the content in any order.

1) Click on Build Content and choose Learning Module.

2) Enter a Name for the module, and add text as desired.

3) Determine if you want users to View materials in sequential order.

4) Determine if you want users to view a Table of Contents.

5) Click Submit.

Adding content to a Learning Module

- You add content to a Learning Module the same way you add content to an ordinary folder. Click on the Module to open it. As content is added, Table of Contents will update.
- To change the position of an item, select a new position number from the drop-down list next to its name.
